STEP 19 — AI LITERACY EVIDENCE

AI Usage Log and Responsible AI Reflection

Purpose of the Document

This document records how AI tools supported my portfolio development and academic projects. I used AI for brainstorming, explanations, writing and paraphrasing, coding assistance, data-analysis explanations, troubleshooting, and document preparation. I remained responsible for checking the results, testing code, following project requirements, and deciding which outputs were appropriate to use.

AI Usage Log

Date	Task	AI Assistance	My Verification
2026-09-22 to 2026-09-24	Data analysis project	Used AI to explain spreadsheet statistics, including mean, median, standard deviation, technician averages, and the relationship between resolution time and customer satisfaction.	Compared explanations and calculations with the Excel data and corrected values when they did not match the source file.
2026-09-23 to 2026-09-24	Research and project documentation	Used AI to expand and improve the introduction for a web-based reservation system, including chatbot support and income/service reports.	Reviewed the wording to ensure it reflected the intended system features and research purpose.
2026-09-27	Game development assignments	Used AI to help draft essays based on videos about game design, user interface design, and sound design.	Reviewed the drafts for relevance to each video topic and adjusted the writing to suit the assignment.
2026-10-08 to 2026-10-10	Website development and troubleshooting	Used AI for help understanding project files, package.json and npm errors, running the project, and locating the favicon setting.	Checked the actual project folder and code, followed the instructions in the development environment, and verified changes by running or refreshing the website.
2026-10-09 to 2026-10-10	Portfolio writing and visual customization	Used AI to paraphrase professional summaries, improve grammar, and guide changes to the portfolio name and browser-tab logo.	Checked that the wording represented my skills and that the suggested file paths and code matched my project.
2026-06-29	Computer security coursework	Used AI to help answer computer-security pretest questions and shorten essay responses.	Reviewed the answers against the questions and kept the responses concise for the assignment.

What did AI help me accomplish?

AI helped me organize ideas, understand technical concepts, improve written explanations, and prepare clearer academic and portfolio materials. It was useful for interpreting spreadsheet results, drafting research content, troubleshooting website issues, and improving the presentation of my portfolio. It also helped me get started when I was unsure how to approach a task.

What did I personally verify?

I checked data-analysis explanations against the original spreadsheet and reviewed whether the results matched the data. For coding tasks, I inspected my project's files and tested changes rather than assuming that generated instructions would work. For writing tasks, I reviewed the wording to make sure it matched my assignment, project features, and personal skills. I also checked visual and formatting changes in the website itself.

What did I learn from using AI?

I learned that AI is most helpful as a support tool, not a replacement for my own understanding or judgment. Clear instructions and relevant examples lead to more useful responses. I also learned to test code, compare data with its original source, and revise generated writing so it fits the task. Understanding why a solution works is important, especially in programming, data analysis, and cybersecurity.

What limitations or errors did I discover in AI-generated answers?

- AI may misunderstand the project or assignment when the instructions do not include enough detail.
- Suggested code or file paths may not match the structure of my actual project and must be checked.
- AI-generated explanations of data can contain incorrect interpretations or calculations if they are not compared with the original values.
- Drafts may be too general, too long, or different from the tone required for the assignment.
- Formatting and layout recommendations may need adjustments after viewing the result in the actual document or website.
- AI cannot automatically confirm that every answer is accurate; I must verify important details before using them.

Responsible AI Use Statement

I used AI as a learning and productivity tool while remaining responsible for my submissions. I reviewed and adapted AI-assisted content, checked data against source files, and tested coding suggestions in my project where applicable. I did not assume that AI outputs were always correct. My goal was to improve my understanding and workflow while ensuring that the final work met the task requirements.

Conclusion

My experience using AI has shown me that AI literacy involves asking clear questions, evaluating responses critically, and verifying results before relying on them. AI can make tasks more efficient, but human judgment is still necessary to ensure accuracy, relevance, and quality. I will continue using AI responsibly as a tool to support my learning and development as an Information Technology student.
