John Marc M. Besmonte
BSIT 4th Year

STEP 24 — FINAL REFLECTION

My Journey as a BSIT Student

Before entering the BSIT program, my understanding of Information Technology was mainly about computers, software, websites, and the use of digital tools. I knew that IT involved programming and computer systems, but I did not fully understand how many areas were connected to the field. Through my studies, I gained a better understanding of how IT professionals plan, develop, test, troubleshoot, and maintain technology-based solutions.

One of the most important lessons I learned in BSIT is that Information Technology is much broader than programming. I studied topics such as web development, databases, networking, cybersecurity, data analysis, system development, and technical documentation. I also learned that solving technical problems requires patience and a systematic approach. It is important to identify the problem, examine possible causes, test solutions, and check whether the solution works correctly.

Working on school projects helped me apply what I learned in class. Developing a system or website requires more than writing code; it also involves planning the features, organizing files, designing the interface, managing data, and testing the system. These activities helped me understand how different parts of an application work together. They also taught me the importance of making improvements based on testing and feedback.

One challenge I experienced during my IT studies was troubleshooting errors and finding the cause of technical problems. Sometimes the issue was not immediately obvious, so I had to review my work carefully and try possible solutions step by step. Although this process could be difficult, it taught me not to give up quickly. I learned that errors are part of development and can help me understand a system better when I take time to investigate them.

My IT skills have developed throughout the BSIT program. I have improved my understanding of programming concepts, web development, databases, system analysis, and project documentation. I have also become more comfortable learning unfamiliar tools and technologies. In addition, I learned that communication, time management, teamwork, and responsibility are important because technical knowledge alone is not enough to complete a successful project.

There are still many skills I want to improve. I want to gain more practical experience, strengthen my programming and networking knowledge, and learn more about cybersecurity and system administration. I also want to become better at testing applications, solving complex problems, and explaining technical information clearly. I understand that technology continues to change, so learning must continue even after graduation.

The kind of IT professional I want to become is someone who can use technology to solve real problems and develop reliable systems. I am interested in continuing to explore different IT career opportunities while building on the knowledge I gained in BSIT. My goal is to find a career path that matches my strengths and interests, gain practical work experience, and continue improving my technical abilities through projects, training, and professional development.

I believe my BSIT journey has prepared me to take the next step toward a career in Information Technology. I may not know everything yet, but I have learned how to approach problems, keep learning, and improve my work through practice. I am ready to gain real-world experience, learn from other IT professionals, and continue developing my skills. My education has given me a foundation, and I will build on it through hard work, curiosity, and continuous learning.
